Week 19

ISSUE

WHAT CHANGED IN THE MAP OF THE WORLD?

The most consequential shift this week is not a new harm — it is a new legal theory about who the law is supposed to protect. On April 24, the US Department of Justice filed its own lawsuit to block Colorado's SB 24-205, a state law requiring companies to test AI tools for unfair gender and race bias before using them in hiring, lending, and student admissions. The DOJ's argument is structurally radical: it claims that *requiring* companies to prevent AI from treating women worse than men may itself be unconstitutional. This reframes anti-discrimination requirements as the violation — not the AI bias they were designed to stop. No federal court has ever ruled on this theory before. Within hours, Colorado's attorney general agreed to stop enforcing the law while the case proceeds, leaving the United States with no active state-level legal mechanism requiring AI systems to be checked for gender bias before deployment.

This happens simultaneously with the collapse of Europe's main AI-law update. On April 28, EU lawmakers failed to reach agreement on changes to Europe's AI Act — meaning stricter rules on AI used in hiring and performance monitoring will now apply automatically in August 2026, but the legal path to get there is uncertain and contested. Both major Western regulatory blocs have arrived at enforcement paralysis — but through opposite failure modes. The US is actively dismantling protections; the EU is frozen by legislative gridlock. Filling the gap are courts: a lawsuit against AI hiring platform Eightfold AI (*Kistler v. Eightfold*), a criminal conviction under the federal TAKE IT DOWN Act for AI-generated non-consensual intimate imagery, and a class-action against xAI's Grok image generator are now the primary accountability mechanisms in operation — not by policy design, but because legislation has stalled or been blocked. Litigation takes years. The gap between now and the first enforceable judicial outcome is a period of near-zero structural accountability for AI gender discrimination in the decisions that matter most to women's economic lives.

TOP 5 SIGNALS

1. DOJ joins Elon Musk's company to kill the only US law requiring AI hiring bias checks

Geography: USA (Colorado), national implications

On April 24, 2026, the US Department of Justice intervened in a lawsuit — *xAI LLC v. Weiser* — originally filed by xAI, the AI company owned by Elon Musk, to block Colorado's SB 24-205. That law would have required any company deploying AI in consequential decisions — job screening, mortgage lending, student admissions — to actively test their systems for unfair treatment of women, racial minorities, and other groups before deployment. The DOJ's argument is that requiring this kind of bias prevention may itself violate the constitutional guarantee of equal protection. Colorado's attorney general agreed to stop enforcing the law while the case is heard. For women in Colorado — and potentially nationally — this means AI systems scoring

job applications can continue operating without any legal obligation to check whether they treat women worse than men. The Colorado legislature's session closes around May 13 without replacement legislation in sight.

AI linkage: The law directly covered AI systems used in employment, lending, education, healthcare, and housing — all sectors with documented AI gender bias. AI hiring tools are now used in an estimated 88–99% of large-employer hiring processes.

Watchpoint: Whether the federal court grants a preliminary injunction and, crucially, whether it issues a written opinion endorsing the equal-protection theory — which would create persuasive precedent affecting AI anti-discrimination bills pending in more than ten other states.

Source: [Court filing and DOJ intervention – xAI LLC v. Weiser, D. Colo., April 24, 2026; covered by Colorado Sun and Law360]

2. EU lawmakers fail to update Europe's AI law — stricter employment AI rules now apply in August by default

Geography: EU-wide

On April 28, 2026, the European Parliament, the Council of the EU, and the European Commission failed to agree on changes to Europe's AI Act — the main law governing how AI systems can be used across the bloc — after roughly twelve hours of negotiation. The talks broke down over technical questions about how AI embedded in medical devices and machinery should be regulated. A further attempt is scheduled for around May 13 under the Cypriot EU Council Presidency, which must close the file before June 30 or hand it to the next presidency. This matters for women because the proposed changes would have postponed until 2027 or 2028 the rules requiring companies to apply human oversight, transparency, and bias monitoring to AI systems used in hiring, performance evaluation, worker monitoring, and termination. The failure means those obligations now apply from August 2, 2026. That is a faster timeline beneficial to women workers in the EU — but the legal uncertainty created by ongoing negotiations makes compliance planning difficult for employers.

The proposed changes also included a new ban on AI tools that generate non-consensual intimate images (so-called nudification tools). That ban is now postponed.

AI linkage: Europe's AI Act classifies AI used in recruitment, performance evaluation, and task allocation as "high-risk," requiring bias monitoring and human oversight. Non-compliance carries fines of up to 7% of global annual revenue.

Watchpoint: Whether the Cypriot Presidency secures a deal before June 30. A deal weakening the employment AI obligations would delay the one binding mechanism protecting women from AI hiring bias across the EU.

3. First federal conviction for AI-generated intimate imagery — platform compliance deadline arrives May 19

Geography: USA

Two developments converge this week. James Strahler II, 37, of Columbus, Ohio, pleaded guilty in early April to cyberstalking and to producing and publishing AI-generated intimate imagery — becoming the first person convicted under the TAKE IT DOWN Act, a federal law signed in 2024 requiring platforms to remove non-consensual intimate images, including AI-generated ones, within 48 hours of a victim's report. He used more than 24 AI applications and over 100 web-based AI tools to generate more than 700 images targeting six adult women and minors, then posted them to a child abuse website. The conviction establishes that the "publication of digital forgeries" charge is prosecutable and provides a template for future cases. The second development: May 19 is the one-year deadline by which social media platforms, hosting services, and user-content platforms must have working removal systems in place. Non-compliance is enforceable by the FTC (the US Federal Trade Commission, which regulates unfair and deceptive trade practices). There is currently no public signal from major platforms — Meta, Google, X — about whether their systems are ready.

AI linkage: The defendant used AI image-generation tools to create the imagery. The law specifically targets AI-generated "digital forgeries" as a criminal category distinct from authentic photography.

Watchpoint: Whether any major platform announces compliance before May 19, or whether the FTC takes enforcement action after May 20. Absence of either would signal that the law is being treated as a paper obligation.

4. Class-action against Grok enters US courts; Dutch court fines xAI €100,000/day; EU parliament holds formal hearing

Geography: USA, Netherlands, UK, EU

Three legal proceedings targeting xAI's Grok image-generation tool — an AI system made by Elon Musk's company that can produce photorealistic images — advanced simultaneously this week. In the US, a class-action lawsuit filed in March on behalf of three minor girls alleges that Grok was deliberately designed to generate sexualized images of real children from their social media photographs, and that the company structured its safety settings to assume "good intent" when users referenced girls or teenagers. The lawsuit bypasses a legal shield (Section 230) that normally protects internet platforms from liability for user content, by arguing Grok itself generates the harmful content rather than merely hosting it. On March 26, an Amsterdam court issued a preliminary injunction requiring xAI to stop — imposing €100,000-per-day fines. The UK's Information Commissioner's Office opened a formal investigation. On May 5, the European Parliament's Committee on Women's Rights and Gender Equality held a dedicated hearing on the case. Elon Musk was summoned to a French parliamentary hearing on April 20 and did not appear.

AI linkage: Grok's image-generation and "Edit Image" features are the direct instruments of harm. The lawsuit alleges this was a foreseeable product design outcome, not a misuse edge case.

Watchpoint: Class certification in the US case; whether the Dutch injunction is upheld on appeal; and whether the FEMM hearing produces a formal legislative request to the European Commission.

Source: [Liefv Cabraser class-action complaint, N.D. Cal., March 16, 2026; Amsterdam District Court preliminary injunction, March 26, 2026; European Parliament FEMM hearing, May 5, 2026]

5. Two women STEM workers sue AI hiring platform used by Microsoft, PayPal, and Salesforce for secretly scoring their applications

Geography: USA (California federal court)

On January 20, 2026, two women with STEM backgrounds — Kistler and Bhaumik — filed suit against Eightfold AI, a talent-screening platform used by some of the largest US employers, including Microsoft, PayPal, Morgan Stanley, Starbucks, Chevron, and Bayer. The lawsuit, filed by the law firms Outten & Golden and Towards Justice, alleges that Eightfold scrapes social media profiles, browsing activity, and device data to build candidate profiles and then scores and filters applicants before any human recruiter sees their application — all without telling applicants this is happening and without giving them the right to dispute their scores. The legal theory is novel: the suit argues that Eightfold is operating as a "consumer reporting agency" under the Fair Credit Reporting Act (FCRA) — a 1970 law requiring companies that compile information about individuals for employment decisions to disclose that information and allow disputes. If courts accept this, every AI hiring vendor that scores candidates using external data may be required to disclose its assessments to job seekers. Eightfold denies the characterization. The case is advancing.

AI linkage: Eightfold is an AI-native platform that uses large language model-based scoring to rank candidates invisibly, behind employer job portals. The FCRA theory, if successful, would require this class of tools to become transparent regardless of the outcome of any state AI law.

Watchpoint: Eightfold's motion to dismiss and the court's response — which will signal whether the FCRA consumer-reporting-agency theory has structural legs as an alternative accountability pathway to state AI anti-discrimination laws now under federal attack.

McKinsey — Women in Tech and AI in Europe (March 5, 2026): Women's share of European tech roles fell from 22% in 2023 to 19% in 2025 — an all-time low. The sharpest declines were at entry level: women's entry-level product management roles fell 17% year-on-year; software engineering fell 13%. The only growing entry-level category — AI, data, and analytics — is being captured at disproportionately higher rates by men. The mechanism is specific: women cluster in product management (39% female) and design (54% female) — the roles most exposed to generative AI automation of task execution. Women are underrepresented in the one growing pathway. McKinsey describes this as a "broken pipeline": STEM graduation rates for women are rising while their share of tech employment falls.

NPWF issue brief (April 28, 2026): The National Partnership for Women & Families applied an AI-adaptability index (Manning & Aguirre, 2026) to American Community Survey microdata (2019–2023) to identify the fifteen most AI-vulnerable US occupations. Result: 86% of the approximately 6.1 million workers in those roles are women. Within that group, women of color are disproportionately concentrated. The occupations at highest risk — secretaries, data-entry clerks, receptionists, payroll clerks — share a profile of routine, codifiable tasks with low skill-transfer potential. The practical implication is not job transition but labor-force exit: limited savings, older average age, and thin reskilling pathways mean displacement is more likely to be permanent than temporary.

DIW Berlin (peer-reviewed, this week): A peer-reviewed analysis from Germany's leading economic research institute challenges the US-derived narrative. The study found that in Germany's occupational structure, AI transformation potential does not align neatly with gendered occupational segregation. Germany's female-dominated care sector and male-dominated manufacturing and craft sectors are both at the low end of AI exposure. Mid-exposure occupations — IT, finance, professional services — have relatively balanced gender compositions. This is a meaningful methodological counterpoint. The most likely explanation is sectoral scope: McKinsey measures the tech sector across Europe; DIW measures the full German economy. The boundary conditions are not yet clear enough to know which framework should drive which policy. Readers should treat both findings as provisionally true within their respective scopes, not as contradictory verdicts on a single question.

UN Women — Tipping Point (April 30, 2026): A survey of 641 women in public-facing roles across 119 countries, conducted in late 2025. Key findings: 6% were targeted by deepfakes or manipulated imagery; 41% of those who experienced digital violence also faced linked offline attacks; more than 40% self-censored on social media; nearly 20% withdrew from professional speaking. Fewer than half of the 119 countries surveyed have any law covering AI-generated deepfake content. This is the largest multi-country empirical study to date on AI-enabled violence against women in public life. The self-censorship figure — 40%+ — is the most structurally significant: it quantifies not individual harm but democratic deficit. Women are being removed from journalism, activism, and political participation by AI-amplified abuse at a scale that now has primary empirical confirmation.

 POLICY MOVEMENT

USA — Colorado SB 24-205 suspended: The DOJ's April 24 intervention in *xAI LLC v. Weiser* — supporting xAI's constitutional challenge — prompted Colorado's attorney general to agree to stop enforcing the law while the case proceeds. Chief Judge Daniel D. Domenico granted the standstill. The law was due to take effect June 30, 2026. It covered AI used in mortgage lending, student admissions, and job-candidate selection. The Colorado legislature's session closes around May 13 with no replacement legislation advancing. The constitutional theory the DOJ is advancing — that requiring companies to prevent AI from producing disparate outcomes based on sex may itself violate equal protection — has no prior judicial precedent. If accepted, it would remove the legal foundation for AI anti-discrimination requirements at the state level nationally.

EU — AI Act Omnibus collapse: The April 28 trilogue failure leaves the EU's original August 2, 2026 deadline for high-risk AI compliance legally intact. Employers and AI vendors deploying systems in EU hiring, performance evaluation, worker monitoring, and termination decisions must comply with mandatory human oversight, transparency, bias monitoring, and documentation requirements. Non-compliance: fines up to 7% of global annual revenue. A third trilogue attempt under the Cypriot Presidency is expected around May 13. If no agreement is reached before June 30, the file passes to Lithuania. This

outcome is a two-sided development: faster mandatory bias oversight is good for women workers; sustained legal uncertainty is bad for orderly implementation.

EU — FEMM Committee hearing (May 5): The European Parliament's Committee on Women's Rights and Gender Equality held its first dedicated hearing on AI-generated sexual violence, using the Grok case as the organising framework. FEMM hearings have a track record of producing committee reports, legislative opinions, and formal requests to the European Commission for regulatory action. This hearing occurred days after the Omnibus collapse — meaning MEPs are formally deliberating on AI-generated sexual violence at exactly the moment the proposed ban on nudification tools is stalled.

USA — TAKE IT DOWN Act: The May 19 platform compliance deadline creates a structural test of US federal AI harm enforcement. The FTC has civil enforcement authority for non-compliant platforms from May 20 onward. No major platform has made a public statement about compliance readiness.

Multi-jurisdiction — Grok investigations: Active investigations or legal proceedings involving Grok are now open in Ireland (Data Protection Commission, GDPR), UK (Ofcom, Online Safety Act; ICO, data protection), France (prosecutors and regulators; Paris office search conducted February 2026), California (state attorney general), and the Netherlands (preliminary injunction, €100,000/day). Japan's Cabinet Office formally summoned X Corp representatives in January 2026.

LABOR MARKET SHIFTS

The most significant labor market development this week is the convergence of two primary datasets pointing to the same structural dynamic from different directions.

McKinsey's European tech data shows women losing ground in existing roles while being excluded from the one growing category. The 17% decline in female entry-level product management roles and 13% decline in software engineering entry-level roles between 2024 and 2025 are not projections — they are measured outcomes. Women's overall share of European tech employment is now at a recorded low of 19%, down from 22% two years ago.

The NPWF brief quantifies the US side: 86% of the 6.1 million workers in the most AI-vulnerable American occupations are women. The specific roles — secretaries, data-entry clerks, receptionists, payroll clerks — are heavily held by women of color. The NPWF explicitly flags that these workers face labor-force exit rather than job transition, because skill-transfer potential is low and safety nets are thin.

In the Global South, a separate displacement dynamic is operating. Women in India, Kenya, and the Philippines make up the majority of the workforce doing data annotation and content moderation — the low-paid human labor that trains AI systems. This work arrived as a first paid employment opportunity for many rural women. It is now being automated: advances in AI-assisted annotation tools have cut labeling time by roughly 50%, and Meta is replacing thousands of content moderators with AI systems. These workers — structurally invisible in formal tech employment statistics — face displacement from the roles they were recruited into to make AI possible, with no reskilling pathway and no labor protections.

The Kistler v. Eightfold lawsuit (see Top 5) adds a transparency dimension: if AI hiring platforms are invisible to candidates, women have no way to know they are being filtered out before a human sees their application, and no mechanism to challenge that outcome.

GENDERED AI RISKS

AI-generated non-consensual intimate imagery (NCII): the infrastructure of harm is confirmed at scale. The UN Women 119-country survey, the TAKE IT DOWN Act conviction, the Grok class-action, and the FEMM hearing together establish this as a documented, quantified, multi-jurisdictional emergency rather than a series of isolated incidents.

The Strahler conviction is operationally significant beyond its individual facts: one person, using more than 24 AI applications and over 100 web-based tools, generated more than 700 images targeting six adult women and minors. The cost was near-

zero. The barrier to entry for this class of harm has collapsed. The conviction demonstrates that the criminal charge — "publication of digital forgeries" — is prosecutable, but criminal prosecution requires identifying the perpetrator. In coordinated campaigns targeting women journalists or politicians, perpetrators operate anonymously.

The UN Women data establishes the aggregate outcome: more than 40% of women in public-facing roles across 119 countries have self-censored on social media as a result of online violence; nearly 20% withdrew from professional speaking. Fewer than half of those countries have laws that cover AI-generated deepfakes. The mechanism is not individual criminal acts — it is systemic deterrence. Women adjust their behavior before any specific threat is made, because the consequences of visibility are known.

In Sub-Saharan Africa, the CIPS policy essay documents AI-generated deepfakes being weaponized against women politicians in Ghana, Namibia, and Senegal. Distribution via WhatsApp reaches constituents before any debunking is possible. Existing legal frameworks — the Maputo Protocol (2003), ECOWAS cybercrime rules designed for email fraud — have no applicable statute. Kenya's Artificial Intelligence Bill 2026, introduced to the Senate in February, would make it the first country in the region with a standalone AI law, but its legislative path is uncertain.

The Grok multi-jurisdictional proceedings represent the most significant legal test of AI generator liability for NCII to date. The US class-action's product liability framing — arguing that the ability to generate sexualized images of real minors was a designed-in feature, not a misuse edge case — is a novel legal theory that, if accepted, would apply to all AI image generators that lack robust age and consent filters.

CULTURAL SIGNALS

The dominant discourse shift of week 19 is a move from "who is legally responsible for AI gender harm" to "is preventing AI gender harm legally permissible at all." The DOJ's intervention reframes the entire conversation: anti-discrimination requirements become the constitutional problem, not the discrimination they were designed to address. This is not rhetorical positioning — it is a legal argument being made in federal court. If it gains traction, it changes what can be demanded of AI companies by law.

Simultaneously, the UN Women report and the TAKE IT DOWN conviction are driving a different framing shift: from "personal safety harm" to "democratic participation deficit." The 40%+ self-censorship figure is the key data point here. It moves the harm category from individual injury to systemic removal of women from public discourse — a governance problem, not just a safety problem. That framing has more policy leverage, and it is being adopted in the FEMM hearing and in UN General Assembly preparation.

These two framings are on a collision course. One is eroding the legal tools available to address AI gender harm. The other is building the evidentiary case that the harm is so structurally serious it requires those tools urgently.

What is conspicuously absent from this week's discourse: trade union and collective bargaining responses to AI-driven layoffs in female-majority sectors — notable given McKinsey's 17% decline in entry-level product management roles. Also absent: any signal from major platforms about compliance preparations ahead of the May 19 TAKE IT DOWN Act deadline. Also missing: coverage of AI exposure in the care economy — healthcare, childcare, eldercare — which is heavily female and structurally distinct from the tech sector that dominates the current data. The post-Dobbs reproductive surveillance dimension — location data, AI health tools, pregnancy detection — remains conspicuously outside the mainstream AI-gender conversation.

The PitchBook "All In" report generated significant coverage this week focused on the headline: record \$73.6 billion to female founders in 2025. The structural finding — that two companies (Anthropic and Scale AI) account for roughly 40% of that figure, and that deal counts for all-female founding teams fell for the fourth consecutive year — received substantially less coverage. The headline is technically accurate and structurally misleading. This pattern of coverage obscures deteriorating conditions for the majority of women-led startups and provides false policy assurance about progress that has not occurred at the aggregate level.

1. Platform silence ahead of the May 19 TAKE IT DOWN Act deadline.

No major platform — Meta, Google, X — has publicly confirmed it has built the required 48-hour removal infrastructure for AI-generated NCII. This silence may reflect genuine compliance preparation underway, or it may signal that platforms intend a minimal, checkbox response. *What would upgrade this signal:* A public compliance announcement from any major platform, or FTC enforcement action against a non-compliant platform after May 20. Absence of both by May 25 would indicate the law's deterrent effect is weaker than its criminal provisions suggest.

2. The Colorado legislature's May 13 session-end with no replacement legislation.

If the Colorado session closes without any amendment to SB 24-205, the law enters an indefinite enforcement standstill while the DOJ/xAI constitutional challenge proceeds — potentially for years. This would leave the US with no active state-level legal mechanism requiring proactive AI bias checks, while also establishing a federal litigation posture that deters other states from enacting equivalent laws. *What would upgrade this signal:* Any Colorado bill advancing in committee before May 10, or a public statement from the state AG about alternative enforcement strategies.

3. The DIW Berlin finding — does it replicate in other European labor markets?

If Germany's occupational structure genuinely insulates it from the gendered AI displacement pattern seen in Anglo-American tech sectors, the policy prescriptions derived from US and pan-European data may not fit continental European labor markets. This has significant implications for EU-level AI labor policy. *What would upgrade this signal:* Any peer-reviewed or major institutional study (OECD, ILO, national statistics office) in France, the Netherlands, or the Nordic countries using comparable methodology within the next four weeks. Replication would require a disaggregated European governance response. Failure to replicate would confine the DIW finding to Germany's specific industrial structure.

4. Grok deepfake case — legislative motion from FEMM.

The May 5 FEMM hearing on AI-generated sexual violence could produce a formal committee report or a request to the European Commission for emergency regulatory action on nudification tools. FEMM has turned hearings into legislative pressure before. *What would upgrade this signal:* A formal FEMM motion or letter to the Commission within three weeks of the hearing, referencing the Grok case as a paradigm for AI-facilitated gender-based violence under the Digital Services Act or the Violence Against Women Directive.

5. Kistler v. Eightfold: the FCRA theory test.

If the court accepts that AI hiring platforms assembling external data on candidates are "consumer reporting agencies" under a 1970 US consumer protection law, the decision would require AI hiring vendors to disclose their scoring to job seekers and allow disputes — regardless of whether any state AI anti-discrimination law survives constitutional challenge. This is the most structurally important alternative accountability pathway for women in hiring. *What would upgrade this signal:* Eightfold files a motion to dismiss (expected within 30 days); or major AI hiring vendors — Workday, HireVue, Beamery — issue public statements about their FCRA compliance posture, signaling they are watching the case as a potential industry-wide liability question.

WHAT THIS MEANS FOR WOMEN IN THE AI ERA

The structural pressure this week is moving in a single, clear direction in the United States: the federal government is now actively litigating to establish that requiring AI systems to treat women fairly is itself a constitutional violation. This is not a rollback of a specific regulation. It is an attempt to make the legal category of "mandatory AI anti-discrimination" impermissible. If successful — even partially, even at the preliminary injunction stage — it will chill equivalent legislation across the states currently considering AI anti-discrimination bills and remove the legal foundation for requiring employers to check whether their hiring tools screen women out. Combined with the Trump administration's parallel directive to the Equal Employment Opportunity Commission to deprioritize cases based on disparate impact (meaning

cases where AI tools treat women worse even without discriminatory intent), this eliminates both the proactive and reactive legal pathways for addressing AI gender bias in US hiring, lending, and education. Women entering the labor market now are doing so in the widest accountability gap that has existed in decades — with the most consequential AI deployment precisely in the decisions that shape economic access.

In Europe, the situation is structurally different but functionally similar in its near-term effect. The Omnibus collapse preserves higher obligations on paper — from August 2026, EU employers must apply human oversight and bias monitoring to AI hiring systems or face fines. But legislative uncertainty, ongoing negotiations, and the absence of enforcement infrastructure mean that paper obligation and actual accountability for AI gender bias in European hiring remain substantially disconnected. What does exist — the Grok class-action, the Dutch injunction, the FEMM hearing, multi-jurisdiction data protection investigations — is emerging through litigation and regulatory enforcement rather than clear legislative mandate. This is better than the US situation, but it is not a functioning system. It is improvised accountability in the absence of settled governance.

The medium-term picture over the next six to eighteen months points toward three structural shifts women should expect to navigate. First, AI hiring tools will continue to operate without mandatory bias disclosure or audit in the US, and with uncertain compliance timelines in the EU — meaning the tools most consequential to women's economic access will remain the least accountable. Second, AI-generated non-consensual intimate imagery will continue to accelerate as a mechanism of political and professional silencing for women in public life, with the TAKE IT DOWN Act providing criminal deterrence at the individual perpetrator level but no structural remedy for coordinated anonymous campaigns — which are the primary threat vector. Third, the capital and labor market data converge on a self-reinforcing exclusion loop: women are being automated out of the roles they hold while being excluded from the capital flows that fund alternatives, with the AI boom serving simultaneously as the headline story of women's progress and the operational mechanism of their exclusion. Understanding that these three dynamics are connected — accountability gaps, safety failures, and economic displacement — is the starting point for any response serious enough to match the scale of what is underway.

Women x AI Radar is published weekly. This edition covers signals from April 29 to May 6, 2026. Signal curation and pattern analysis by the Radar's three-layer intelligence process. Sources cited inline.
